Complete End-to-End Gen AI Project on AWS Using AWS Bedrock and AWS Lambda

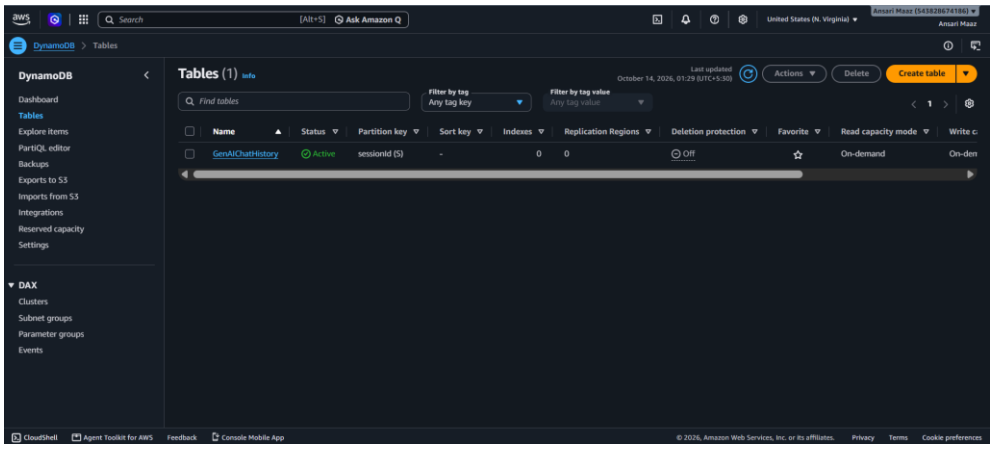

>click model access > click model catlog > amazon nova micro

>come and open at playground

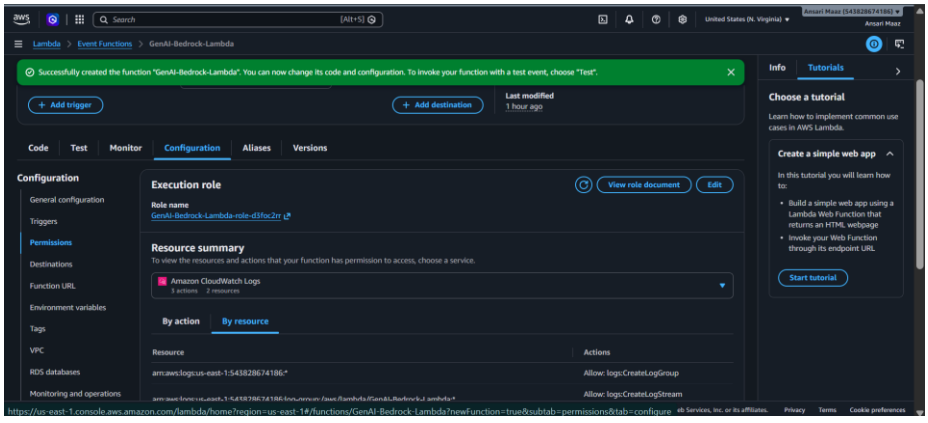

>create dynamoDB table (name== GenAIChatHistory)

>partition is == sessionId – string

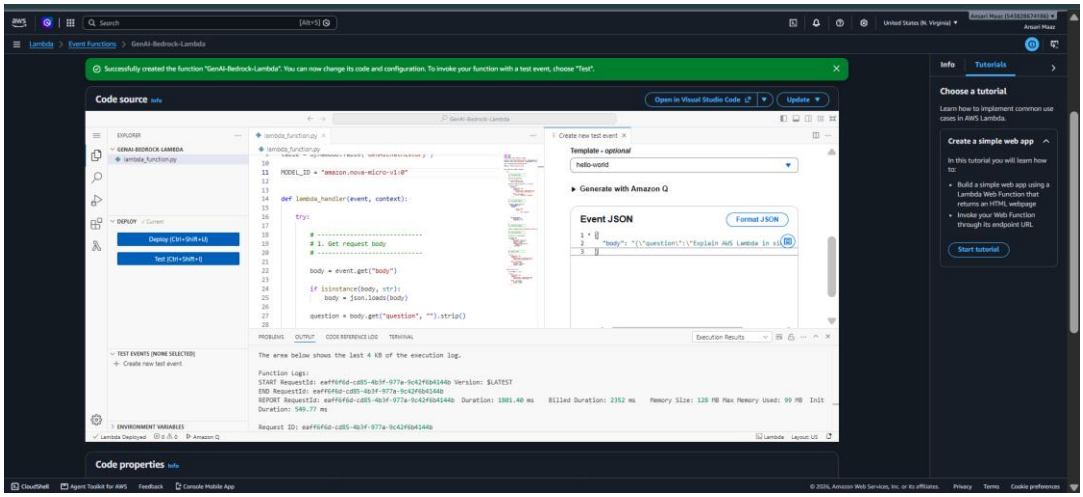

>create lambda function (name==GenAI-Bedrock-Lambda) > select –python > lambda

>configuration >permission > role name > attach policy > dynamofullAccess & bedrockFA

>open code editor > deploy > test

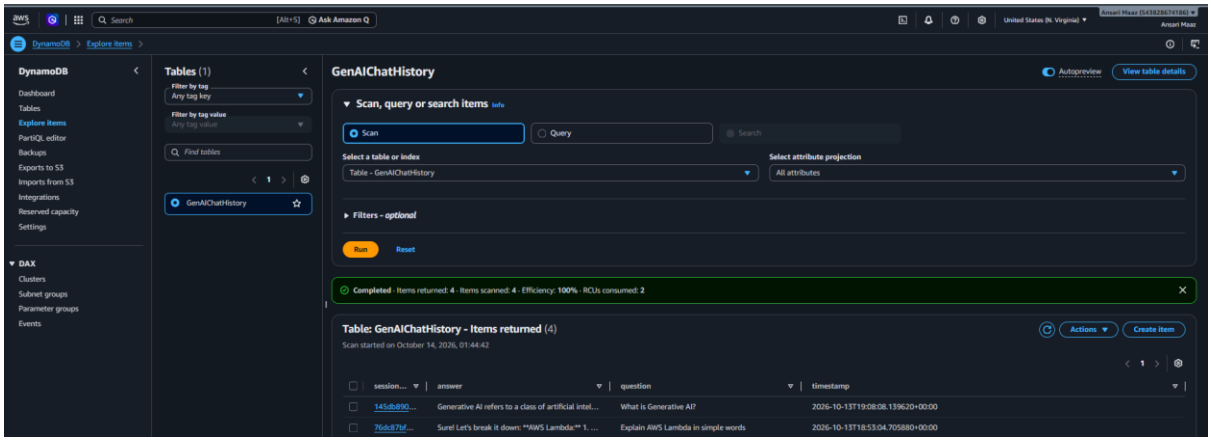

>test on CMD

> curl -X POST "https://2ax8l8uvql.execute-api.us-east-1.amazonaws.com/ask" -H "Content-Type: application/json" -d "{\"question\":\"What is Generative AI?\"}"

```
C:\Users\DELL>curl -X POST "https://2ax8l8uvql.execute-api.us-east-1.amazonaws.com/ask" -H "Content-Type: application/json" -d "{\"question\":\"What is Generative AI?\"}"
{"success": true, "question": "What is Generative AI?", "answer": "Generative AI refers to a class of artificial intelligence models capable of generating new data, such as images, text, audio, and other types of content. Unlike traditional AI models that are typically designed to perform specific tasks such as classification or regression, generative AI models focus on creating outputs that are similar to those produced by humans.\n\n### Key Concepts of Generative AI\n\n1. **Data Generation**: Generative AI models can produce new data points that are statistically similar to a training dataset. This can include generating new images, composing music, writing stories, or creating synthetic data for simulations.\n\n2. **Training Process**: These models are trained on large datasets to learn the underlying patterns and structures. They often use advanced neural network architectures like Generative Adversarial Networks (GANs), Variational Autoencoders (VAEs), and more recent transformer-based models.\n\n3. **Applications**:\n   - **Art and Creativity**: Generating paintings, music, poetry, and other forms of creative content.\n   - **Data Augmentation**: Creating synthetic datasets to improve machine learning models.\n   - **Text Generation**: Writing articles, stories, and even code.\n   - **Image Generation**: Creating realistic images, including faces, landscapes, and objects.\n   - **Game Design**: Generating levels, assets, and narratives for video games.\n\n### Popular Generative AI Models\n\n1. **Generative Adversarial Networks (GANs)**:\n   - **Structure**: GANs consist of two neural networks: a generator and"}

```

>succesfull done > now we can see(dynamodb)

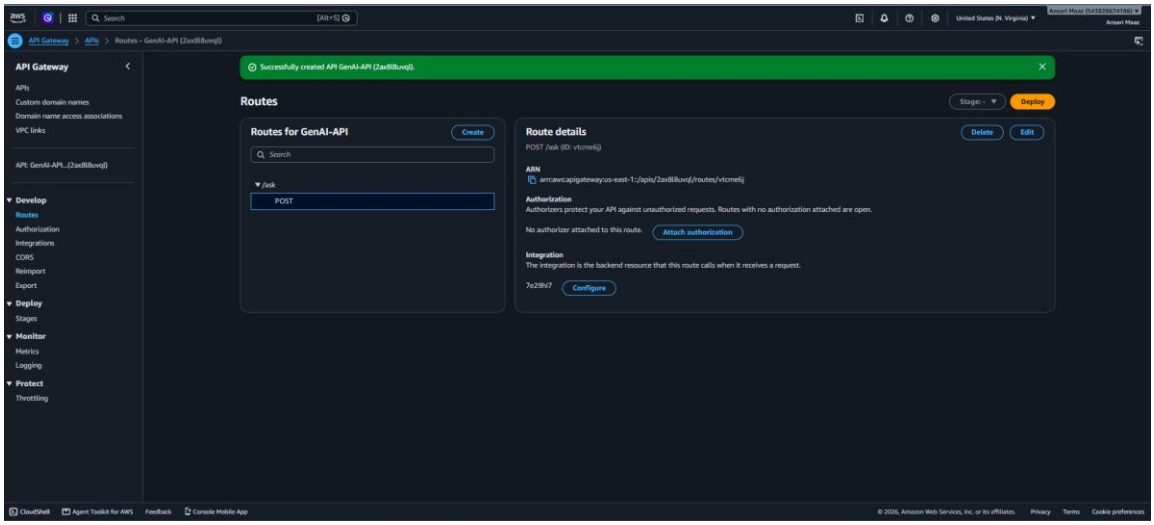

>create api gateway(name=== GenAI-API) > http api > build

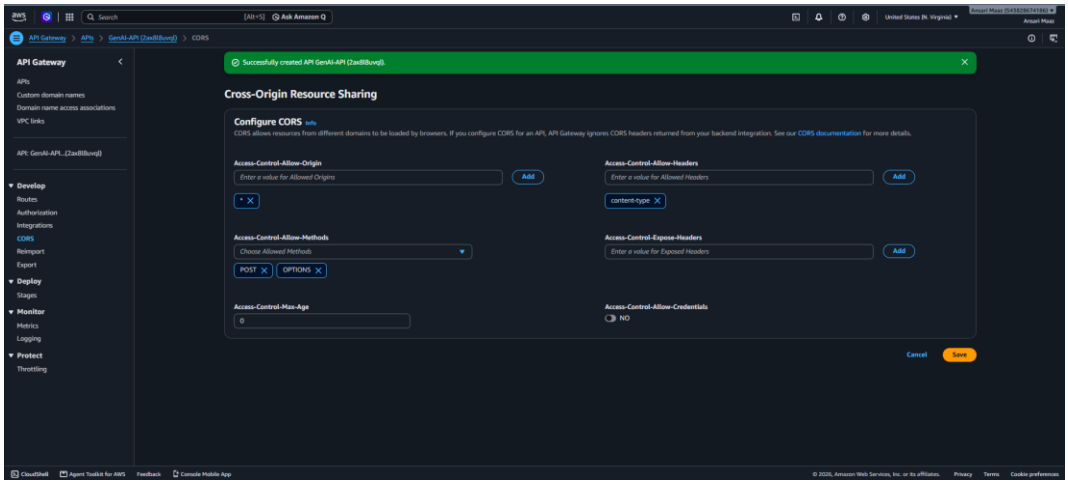

>integration > lambda

>add route > POST /ask

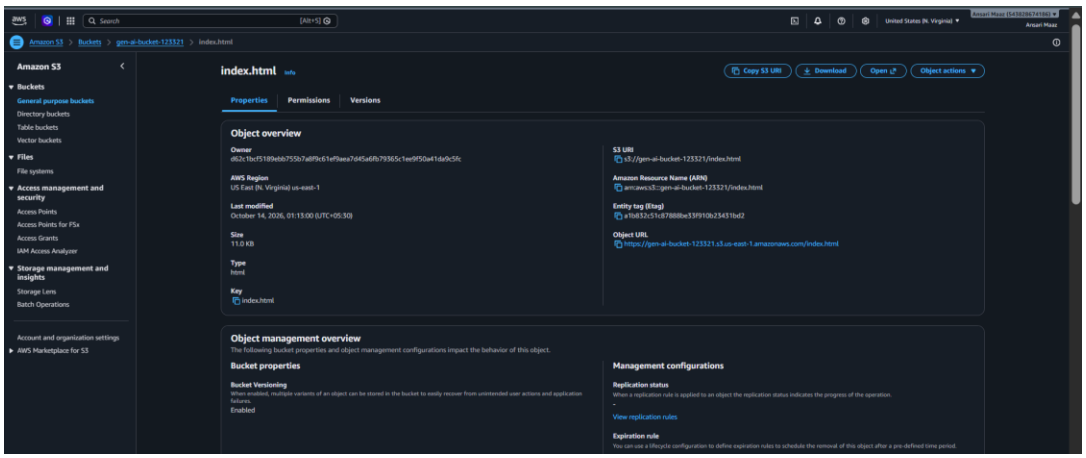

>create

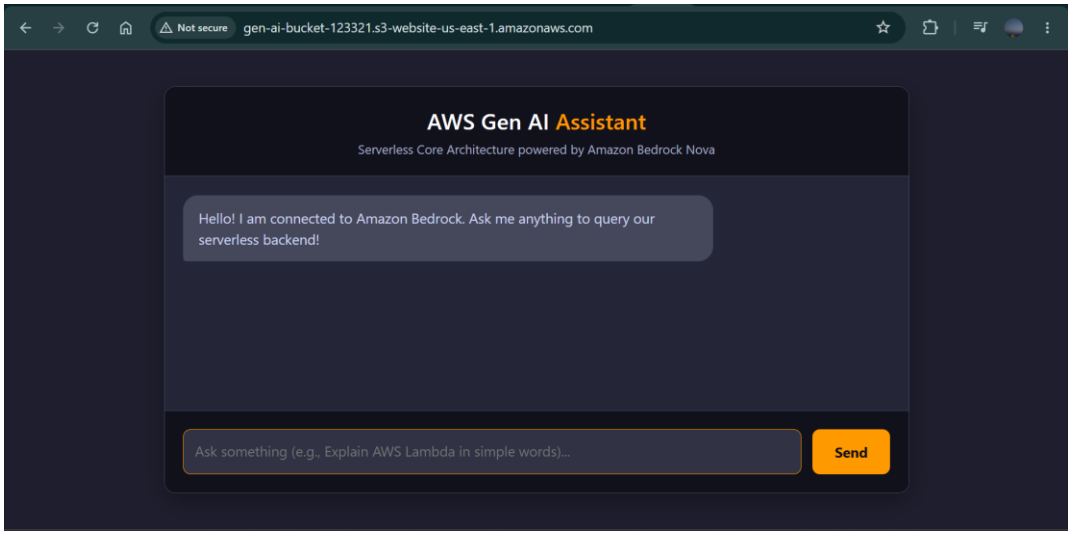

>edit corn

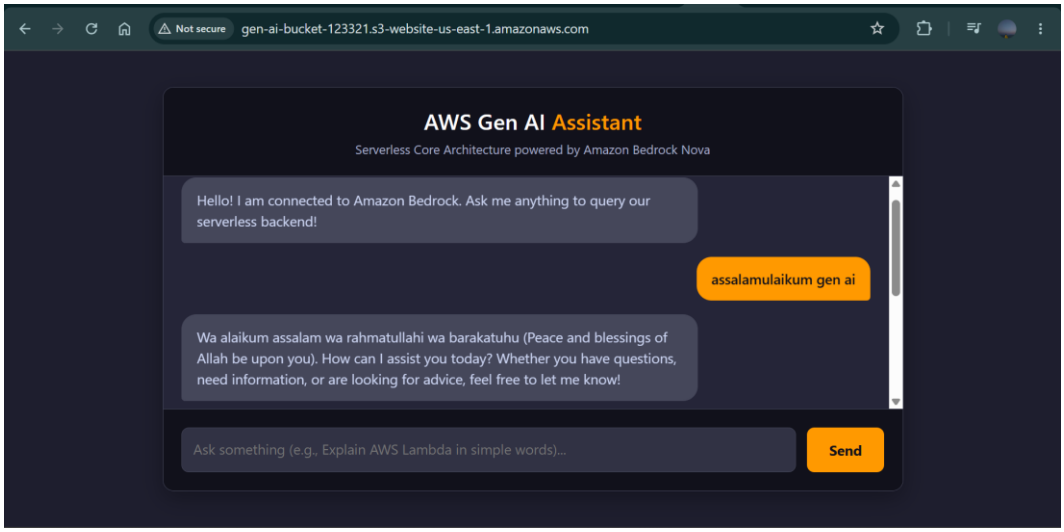

>open s3 bucket > upload index.html > enble static website hosting > edit bucket policy

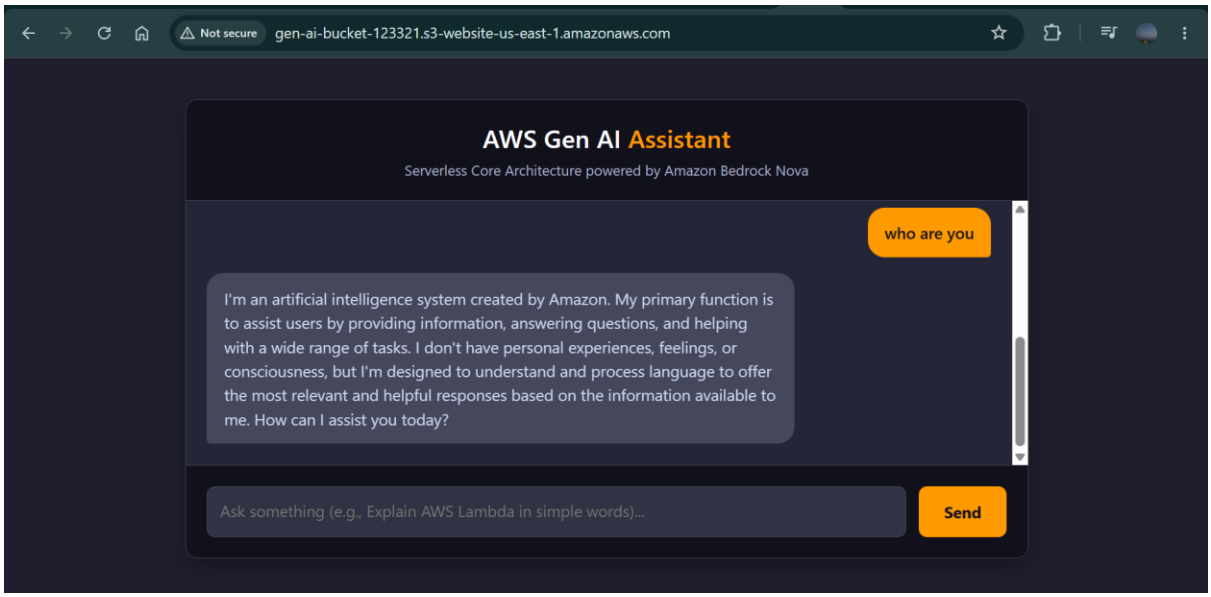

>copy and paste url

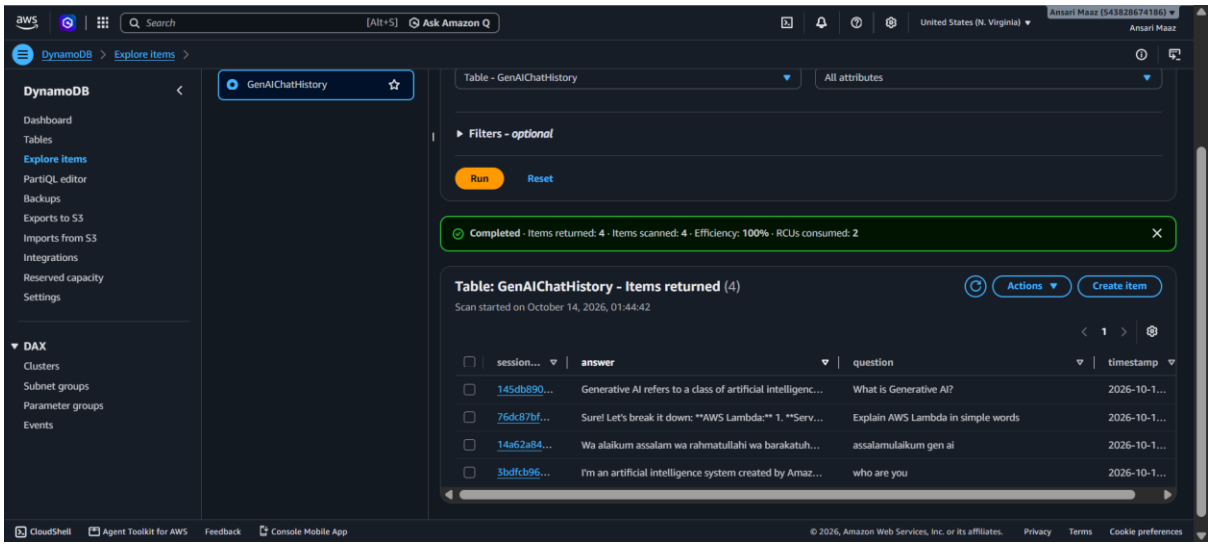

>ask something to amazon nova

>now check the history is stored in db or not >open dynamodb

> successful done >here we can see

>open cloudwatch and check events and logs
